

Readme:

to install prototype, you need install Docker and docker-compose.

After installing docker and docker-compose, unzip prototype.zip in the folder. write in the terminal:

```
$ docker-compose build
```

if you do not find problems, type,
docker-compose up -d

after if you want stop or start the container just with type in the terminal:

```
$docker-compose start
```

and

```
$docker-compose stop
```

if you want to see the IP of the container , you type:

```
$docker inspect NAME-CONTAINER | grep IP
```

if you want to delete a stopped container, you type:

```
docker-compose rm
```
